

Global IoT Orchestration

Verizon Global IoT Orchestration streamlines out-of-box wireless connectivity for connected products in the US and abroad using eSIM technology. With ThingSpace APIs, switching between Verizon and international eSIM profiles is a breeze.

Use case: Global utility manufacturer

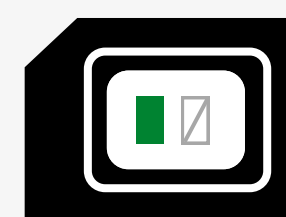

Challenge

A global utility manufacturer and services company needs to safely, securely, and reliably deliver smart critical infrastructure services to communities in 100+ countries.

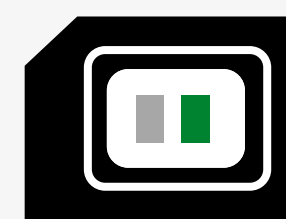

Solution

Verizon Global IoT Orchestration supports low-power connectivity for wireless smart meters, making it easier for multi-national AMI technology providers to deploy their services globally from a single production facility. Out-of-box connectivity allows utility providers and cities to quickly monitor & deliver critical infrastructure services to communities worldwide as soon as the smart meters are powered on.

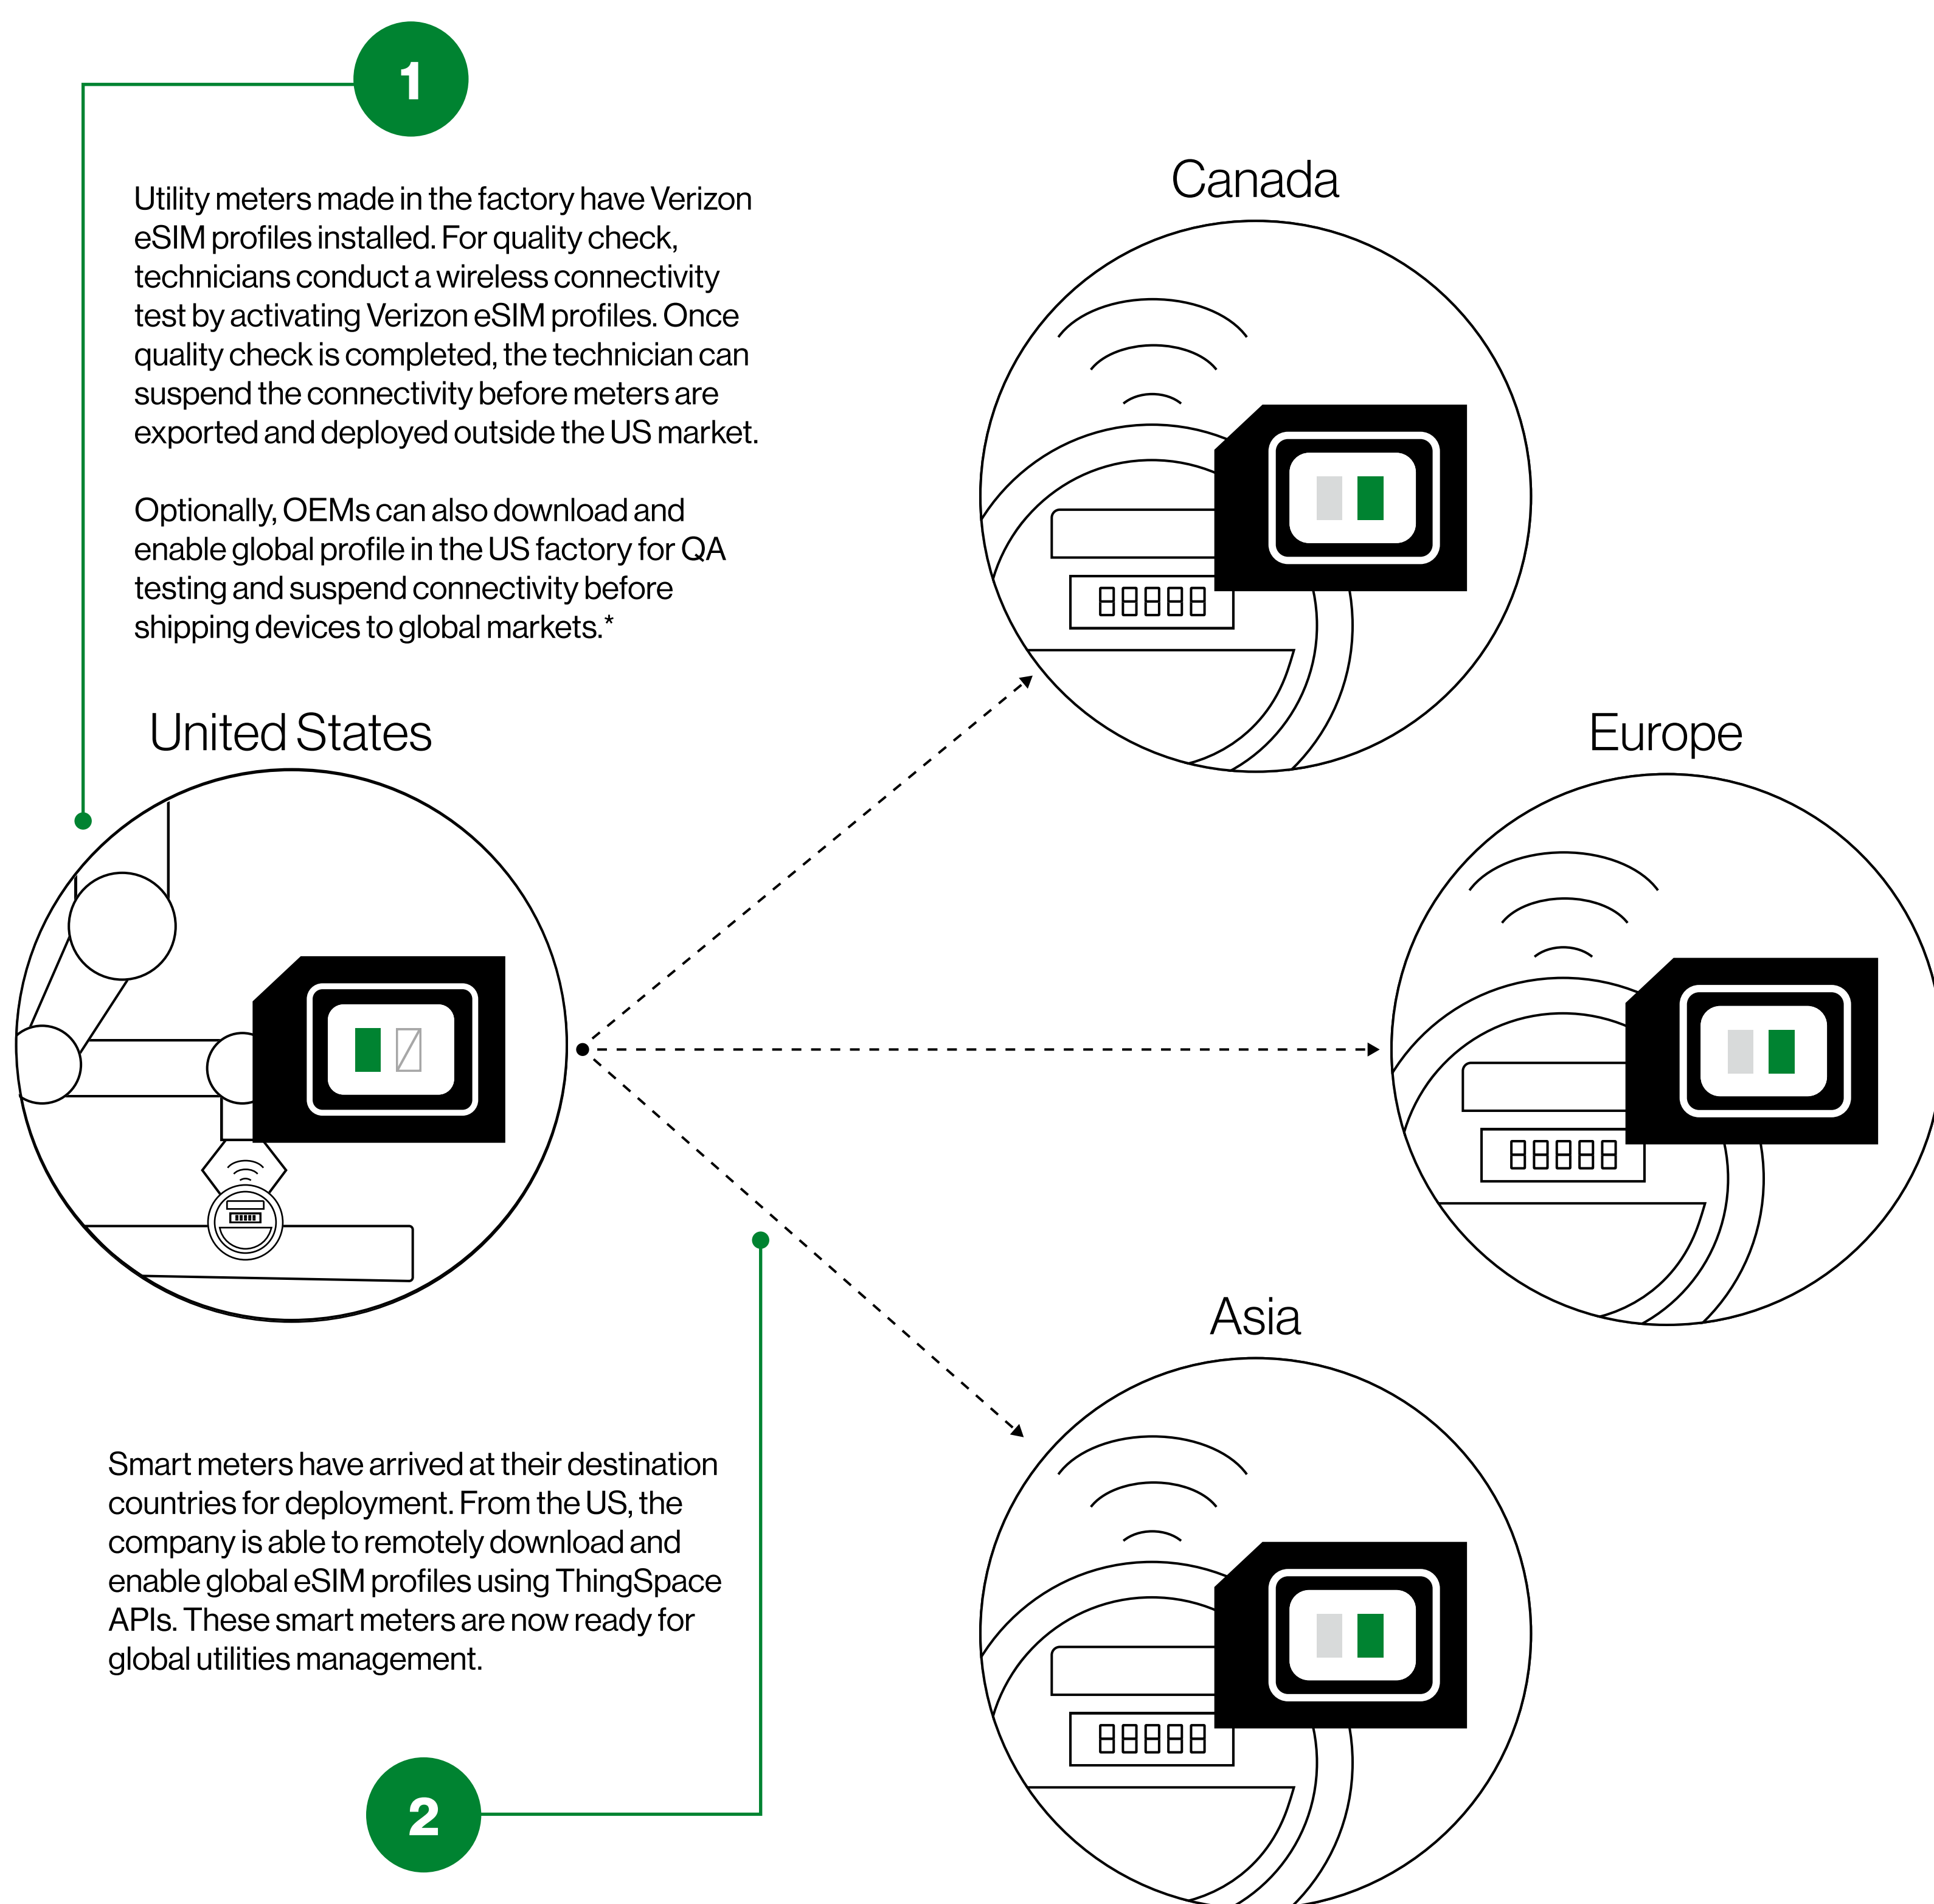

Infographic key

- US bootstrap profile activated

- US bootstrap profile disabled
- Global profile downloaded & enabled

*Option to pre-load global eSIM profiles will be available in future releases.
